The charts below compare the age structure of the populations of France and India in 1984.

下方的柱状图比较了法国和印度1984年的人口年龄结构

The two charts compare the populations of France and India in terms of age distribution by gender in the year 1984.

It is clear that the population of India was younger than that of France in 1984, with a noticeably larger proportion of people aged under 20. France, on the other hand, had a significantly larger percentage of elderly inhabitants.

In India, close to 14% of people were aged 5 or under, and each five-year age bracket above this contained an increasingly smaller proportion of the population. France's population, by contrast, was more evenly distributed across the age ranges, with similar figures (around 7% to 8% of all people) for each five-year cohort between the ages of 0 and 40. Somewhere between 10% and 15% of all French people were aged 70 or older, but the equivalent figure for India was only 2%.

Looking more closely at gender, there was a noticeable higher proportion of French women than men in every cohort from age 50 upwards. For example, almost 3% of French 70-to 75-year-olds were women, while just under 2% were men. No significant gender differences can be seen on the Indian population chart.

The bar graph shows the global sales (in billions of dollars) of different types of digital games between 2000 and 2006

此柱状图显示 2000 年到 2006 年间不同类型的电子游戏的全球销售额(单位:一亿美元)

The bar chart compares the turnover in dollars from sales of video games for four different platforms namely mobile phones, online, consoles and handheld devices. from 2000 to 2006.

It is clear that sales of games for three out of the four platforms rose each year, leading to a significant rise in total global turnover over the 7-year period. Sales figures for handheld games were at least twice as high as those for any other platform in almost every year.

In 2000, worldwide sales of handheld games stood at around \$11 billion, while console games earned just under \$6 billion. No figures are given for mobile or online games in that year. Over the next 3 years, sales of handheld video games rose by about \$4 billion, but the figure for

consoles decreased by \$2 billion Mobile phone and online games started to become popular.with sales reaching around \$3 billion in 2003

In 2006, sales of handheld, online and mobile games reached peaks of 17.9 and 7 billion dollars respectively. By contrast, turnover from console games dropped to its lowest point, at around \$2.5 billion.

The chart below shows the total number of Olympic medals won by twelve different countries.

此长条图显示了 20 个国家获得金银铜奥运奖牌数量.

The bar chart compares twelve countries in terms of the overall number of medals that they have won at the Olympic games.

It is clear that the USA is by far the most successful Olympic medal winning nation. It is also noticeable that the figures for gold silver and bronze medals won by any particular country tend to be fairly similar.

The USA has won a total of around 2,300 olympic medals, including approximately 900 gold medals, 750 silver and 650 bronze. In second place on the all-time medals chart is the Soviet Union, with just over 1,000 medals. Again, the number of gold medals won by this country is slightly higher than the number of silver or bronze medals

Only four other countries-the UK, France, Germany and Italy -have won more than 500 olympic medals, all with similar proportions of each medal colour. Apart from the USA and the Soviet Union, China is the only other country with a noticeably higher proportion of gold medals (about 200) compared to silver and bronze (about 100 each).

The charts below show the main reasons for study among students of different groups and the amount of support they received from employers.

下方的柱状图说明来自不同年龄段的学生学习的主要动机和受到来自雇主支持的比例。

The bar charts compare students of different ages in terms of why they are studying and whether

they are supported by an employer.

It is clear that the proportion of students who study for career purposes is far higher among the younger i age groups. while the oldest students are more likely to study for interest. Employer support is more commonly given to younger students.

Around 80% of students aged under 26 study to further their careers, whereas only 10% study purely out of interest. The gap between these two proportions narrows as students get older, and the figures for those in their forties are the same. at about 40%. Students aged over 49 overwhelmingly study for interest(70%) rather than for professional reasons (less than 20%).

Just over 60% of students aged under 26 are supported by their employers. By contrast, the 30-39 age group is the most self-sufficient, with only 30% being given time off and help with fees. The figures rise slightly for students in their forties and for those aged 50 orMore.

The chart below shows numbers of incidents and injuries per 100 million passenger miles travelled

(PMT) by transportation type in 2002.

下面的图表显示了 2002 年乘客乘坐交通工具每 1 亿英里(PMT)的事故数量和受伤人数。

The bar chart compares the number of incidents and injuries for every 100 million passenger miles travelled on five different types of public transport 2002.

It is clear that the most incidents and injuries took place on demand-response vehicles. By contrast, commuter rail services recorded by far the lowest figures

A total of 225 incidents and 173 injuries, per 100 million passenger miles travelled, took place on demand-response transport services. These figures were nearly three times as high as those for

the second i highest category. bus services. There were 76 incidents and 66 people were injured on buses.

Rail services experienced fewer problems. The number of incidents on light rail trains equalled the figure recorded for buses, but there were significantly fewer i injuries, at only 39. Heavy rail services saw lower numbers of such events than light rail services. but commuter rail passengers were even less likely to experience problems. In fact, only 20 incidents and 17 injuries occurred on commuter trains

The chart below shows information about changes in average house prices in five different cities between 1990 and 2002 compared with the average house prices in 1989

下面的图表显示了与 1989 年的平均房价相比,1990 年至 2002 年间五个不同城市的平均房价变化情况。

The bar chart compares the cost of an average house in five major cities over a period of 13 years from 1989

We can see that house prices fell overall between 1990 and 1995, but most of the cities saw rising prices between 1996 and 2002. London experienced by far the greatest changes in house prices over the 13-year period

Over the 5 years after 1989, the cost of average homes in Tokyo and London dropped by around 7%, while in New York house prices went down by 5%. By contrast, prices rose by approximately 2% in both Madrid and Frankfurt.

Between 1996 and 2002, London house prices jumped to around 12% above the 1989 average. Homebuyers in New York also had to pay significantly more, with prices rising to 5% above the 1989 average, but homes in Tokyo remained cheaper than they were in 1989. The cost of an average home in Madrid rose by a further 2%, while prices in Frankfurt remained stable.

The bar chart below shows money spent on consumer goods in different countries.

下面的柱状图显示了在不同国家消费购买不同商品所花费的金钱比较

The bar chart compares consumer spending on six different items in Germany, Italy, France and Britain.

It is clear that British people spent significantly more money than people in the other three countries on all six goods. Of the six items, consumers spent the most money on photographic film.

People in Britain spent just over £70,000 on photographic film, which is the highest figure shown on the chart. By contrast, Germans were the lowest overall spenders, with roughly the same figures (just under £150,000) for each of the six products.

The figures for spending on toys were the same in both France and Italy, at nearly £160,000. However, while French people spent more than Italians on photographic film and CDs, Italians paid out more for personal stereos, tennis racquets and perfumes. The amount spent by French people on tennis racquets around £145,000, is the lowest figure shown on the chart.

The charts below show the levels of participation in education and science in developing and industrialised countries in 1980 and 1990.

下面的图表显示了1980年和1990年发展中国家和工业化国家的受教育程度、科学发展水平。

The three bar charts show average years of schooling, numbers of scientists and technicians, and research and development spending in developing and developed countries. Figures are given for 1980 and 1990.

It is clear from the charts that the figures for developed countries are much higher than those for developing nations. Also, the charts show an overall increase in participation in education and science from 1980 to 1990.

People in developing nations attended school for an average of around 3 years, with only a slight increase in years of schooling from 1980 to 1990. On the other hand, the figure for industrialised countries rose from nearly 9 years of schooling in 1980 to nearly 11 years in 1990.

From 1980 to 1990, the number of scientists and technicians in industrialised countries almost doubled to about 70 per 1000 people. Spending on research and development also saw rapid growth in these countries, reaching \$350 billion in 1990. By contrast, the number workers in

developing countries remained Of science below 20 per 1000 people, and research spending fell from about \$50 billion to only \$25 billion
